Brother Refill Tools (Version 2)

The Brother refill tools are a innovative tool which allows easy filling of a wide range of OEM Brother cartridges easily.

<u>Syringe Method</u>

1. Make sure there is adequate quantity of ink to fill the cartridge in the bottle before starting. Attach the fitting at the end of the tube over the plunger valve as shown in the photos below. Push or turn the fitting onto the cartridges to ensure a firm fitting.
2. Insert a 50(60ml) syringe into the top of the bottle. Pull back on the syringe as far as you can go and then release the syringe. As you pull back on the syringe you are removing air from the cartridge and as you release it ink is filling into the cartridge.
3. Repeat Step 2 until the cartridge is full. The ink level of the cartridge can be easily seen by looking at the clear sight window located on the cartridge. Alternatively a comparison against new OEM cartridge weight can be used.

<u>Vacuum Chamber Method</u>

1. Make sure there is adequate quantity of ink to fill the cartridge in the bottle before starting.
2. Attach the fitting at the end of the tube over the plunger valve as shown in the photo. Push or turn the fitting onto the cartridges to ensure a firm fitting.
3. Put the refill tool and cartridge inside the vacuum chamber.
4. Turn on the vacuum until you reach maximum maximum. Slightly different vacuum settings maybe required for different vacuum filling machines. Adjust your settings to achieve the best results.
5. Release the vacuum, as air enters the chamber the cartridge will fill.
6. Check the ink level visually or compare against OEM weights, repeat steps 4 and 5 as required.
